

ABSTRACT OF THE DISCLOSURE

A system is set forth for the exothermic generation of soot depleted syngas
5 comprising (i) reacting a hydrocarbon-containing fuel with an oxygen containing gas in a
first reactor to produce the syngas and byproducts comprising CO₂, H₂O and soot; and
(ii) introducing the syngas and byproducts into a second reactor containing a non-
carbonaceous material that traps the soot for a sufficient time such that the majority of
the byproduct soot is gasified via reaction with the byproduct CO₂ and/or H₂O to produce
10 a syngas stream that is depleted in the soot. The system is particularly suitable for the
practice of heat exchange reforming wherein a portion of the heat is recovered from the
soot depleted syngas stream and used as at least a portion of the heat to facilitate the
additional production of syngas via the (endothermic) catalytic reforming of natural gas
and steam.
